

James Stallkamp

CS373

Lab 1

I started off lab 1 using the strings command to find important pieces of the syntax and immediately saw things like phase_1 through phase_6, as well as a secret and much more useful information to defuse this bomb.

Strings bomb:

```
File Actions Edit View Help
data_start
printf@GLIBC_2.0
phase_4
blank_line
_fini
fclose@GLIBC_2.1
infile
open_clientfd

socket@GLIBC_2.0
phase_1
skip
node2
cuserid@GLIBC_2.0
__gmon_start__
strcpy@GLIBC_2.0
```

Phase 1

I then examined the object dump file for this file and quickly found sections in the assembly for each phase of the bomb.

Used objdump -d bomb > bomb-assembly

Looked at assembly code found

```

8048ab8:  83 c4 20         add $0x20,%esp
330,58-66 22%
```

I found that for phase 1 it was comparing a string stored in eax so I decided to examine what characters were in that register

Checking eax

```
(gdb) x /25c 0x80497c0
0x80497c0:  80 'P' 117 'u' 98 'b' 108 'l' 105 'i' 99 'c' 32 ' ' 115 's'
0x80497c8:  112 'p' 101 'e' 97 'a' 107 'k' 105 'i' 110 'n' 103 'g' 32 ' '
0x80497d0:  105 'i' 115 's' 32 ' ' 118 'v' 101 'e' 114 'r' 121 'y' 32 ' '
0x80497d8:  101 'e'
(gdb)
```

I found characters “public speaking is very e”

I checked strings and found “public speaking is very easy.” That is probably password 1.

Phase 1 password : public speaking is very easy.

```
(root@kali:pts/3) ./bomb
Welcome to my fiendish little bomb. You have 6 phases with which to blow yourself up. Have a nice day!
Public speaking is very easy.
Phase 1 defused. How about the next one?
```

Phase 2

After successfully doing phase 1 I went back to object dump file and looked at phase 2 and found the read_six_numbers being called.

```
8048b59: 50          push    %eax
8048b5a: 52          push    %edx
8048b5b: e8 78 04 00 00 call    8048fd8 <read_six_numbers>
8048b60: 83 c4 10    add     $0x10,%esp
8048b63: 83 7d e8 01  cml     $0x1,-0x18(%ebp)
8048b67: 74 05       je      8048b6e <phase_2+0x26>
8048b69: e8 8e 09 00 00 call    80494fc <explode_bomb>
8048b6e: bb 01 00 00 00 mov     $0x1,%ebx
8048b73: 8d 75 e8    lea     -0x18(%ebp),%esi
8048b76: 8d 43 01    lea     0x1(%ebx),%eax
8048b79: 0f af 44 9e fc imul    -0x4(%esi,%ebx,4),%eax
```

I checked Func read_six_numbers and found this. This is reading in 6 numbers in the format “1 2 3 4 5 6”

```
08048fd8 <read_six_numbers>:
8048fd8: 55          push    %ebp
8048fd9: 89 e5       mov     %esp,%ebp
8048fdb: 83 ec 08    sub     $0x8,%esp
8048fde: 8b 4d 08    mov     0x8(%ebp),%ecx
8048fe1: 8b 55 0c    mov     0xc(%ebp),%edx
8048fe4: 8d 42 14    lea     0x14(%edx),%eax
8048fe7: 50          push    %eax
8048fe8: 8d 42 10    lea     0x10(%edx),%eax
8048feb: 50          push    %eax
8048fec: 8d 42 0c    lea     0xc(%edx),%eax
8048fef: 50          push    %eax
8048ff0: 8d 42 08    lea     0x8(%edx),%eax
8048ff3: 50          push    %eax
8048ff4: 8d 42 04    lea     0x4(%edx),%eax
8048ff7: 50          push    %eax
8048ff8: 52          push    %edx
8048ff9: 68 1b 9b 04 08 push    $0x8049b1b
8048ffe: 51          push    %ecx
8048fff: e8 5c f8 ff ff call    8048860 <scanf@plt>
8049004: 83 c4 20    add     $0x20,%esp
8049007: 83 f8 05    cmp     $0x5,%eax
804900a: 7f 05       jg      8049011 <read_six_numbers+0x39>
804900c: e8 eb 04 00 00 call    80494fc <explode_bomb>
8049011: 89 ec       mov     %ebp,%esp
8049013: 5d          pop     %ebp
8049014: c3         ret
8049015: 8d 76 00    lea     0x0(%esi),%esi
```

So using gdb I decided to debug what happens when I try six random numbers like 1 2 3 4 5 6.

Use I r command to see contents of registers that was being compared, went through the loop and found 1 2 6 24 120 720. Which must be the password for the second phase

```

BOOM!!!
The bomb has blown up.
[Inferior 1 (process 90659) exited with code 010]
(gdb) exit
(R00T@kali:pts/3)
(01:10:0) ./bomb
Welcome to my fiendish little bomb. You have 6 phases with
which to blow yourself up. Have a nice day!
Public speaking is very easy.
Phase 1 defused. How about the next one?
1 2 6 24 120 720
That's number 2. Keep going!

```

Phase 2 password: 1 2 6 24 120 720

Phase 3

Going back to the object dump file I went to the lines for phase 3 and noticed it was using scanf and then comparing several values in a certain location. So I decided to use a test string and look at what those values are.

```

8048bb1: 66 4c 97 04 00      push    $0x0049704
8048bb6: 52                  push    %edx
8048bb7: e8 a4 fc ff ff      call    8048860 <sscanf@plt>
8048bbc: 83 c4 20             add     $0x20,%esp
8048bbf: 83 f8 02             cmp     $0x2,%eax
8048bc2: 7f 05               jg      8048bc9 <phase_3+0x31>
8048bc4: e8 33 09 00 00      call    80494fc <explode_bomb>
8048bc9: 83 7d f4 07          cmpl    $0x7,-0xc(%ebp)
8048bcd: 0f 87 b5 00 00 00    ja      8048c88 <phase_3+0xf0>
8048bd3: 8b 45 f4             mov     -0xc(%ebp),%eax
8048bd6: ff 24 85 e8 97 04 08 jmp     *0x80497e8(,%eax,4)
8048bdd: 8d 76 00             lea     0x0(%esi),%esi
8048be0: b3 71               mov     $0x71,%bl
8048be2: 81 7d fc 09 03 00 00 cmpl    $0x309,-0x4(%ebp)
8048be9: 0f 84 a0 00 00 00    je      8048c8f <phase_3+0xf7>
8048bef: e8 08 09 00 00      call    80494fc <explode_bomb>
8048bf4: e9 96 00 00 00      jmp     8048c8f <phase_3+0xf7>
8048bf9: 8d b4 26 00 00 00 00 lea     0x0(%esi,%eiz,1),%esi
8048c00: b3 62               mov     $0x62,%bl

```

```

Breakpoint 1, 0x08048b9f in phase_3 ()
(gdb) x/s 0x0804b721
0x804b721 <input_strings+161>: " 1 2"
(gdb) x/s 0x080497de
0x80497de: "%d %c %d"
(gdb) p/x $edx
$1 = 0x804b721
(gdb) x/s 0x0804b721
0x804b721 <input_strings+161>: " 1 2"
(gdb) 

```

Here I was able to see that the format of the next key must be “int char int” and that the first number is 1 and followed by a 2, which seems odd since the format should have been int char int. This makes me think maybe 2 is actually part of the second number and the character is being checked elsewhere. I found that it was then comparing against the value \$0xd6 which corresponds to value 214 which when combined with 2 means that the second integer must be 214.

For the character I found it was comparing to the value in -0x5(%ebp).

```

8048c88: b3 78               mov     $0x78,%bl
8048c8a: e8 6d 08 00 00      call    80494fc <explode_bomb>
8048c8f: 3a 5d fb             cmp     -0x5(%ebp),%bl
8048c92: 74 05               je      8048c99 <phase_3+0x101>
8048c94: e8 63 08 00 00      call    80494fc <explode_bomb>
8048c99: 8b 5d e8             mov     -0x18(%ebp),%ebx

```

I examined that register and found 62 in hex which corresponds to 98 in decimal and the character ‘b’.

So the password must be 1 b 214

```
(8:01:35.4) ./bomb
Welcome to my fiendish little bomb. You have 6 phases with
which to blow yourself up. Have a nice day!
Public speaking is very easy.
Phase 1 defused. How about the next one?
1 2 6 24 120 720
That's number 2. Keep going!
1 b 214
Halfway there!
```

Phase 4

Looking at the assembly for phase 4 I found this func4 function that was being used. I also immediately recognized that func4 was calling itself so we are dealing with a recursive function.

```
08048ca0 <func4>:
8048ca0: 55                push    %ebp
8048ca1: 89 e5             mov     %esp,%ebp

```

To solve this recursive function my first thought was to find the base case, which I found because the function was campaign its input to 1, so this must be the base case. During the recursive step the

function calls itself twice and passes input-1 and input-2 into the calls. So it appears that $f(x) = F(x-1)+f(x-2)$.

Going back to the assembly for phase 4 I found that whatever comes out of func4 has to equal hex 37 or dec 55. The function from func4 is clearly a Fibonacci sequence so we need a fib number to generate 55 and remember it will need to be n-1. So Fib number 10 corresponds to 55, meaning the password should be 9.

```

Welcome to my fiendish little bomb. You have 6 phases with
which to blow yourself up. Have a nice day!
Public speaking is very easy.
Phase 1 defused. How about the next one?
1 2 6 24 120 720
That's number 2. Keep going!
1 b 214
Halfway there!
9
So you got that one. Try this one.

```

Phase 5

Starting on phase 5, looking at object code.

804902e:    5d               pop     %ebp
804902f:    c3               ret

```

Looking at the assembly for phase 5 I quickly noticed several things. I found a string_length function and a register being used in a loop. I found the value being compared to be 6 which means the password for this phase must be 6 long. I also noticed that it was comparing against characters, so we are looking for 6 characters. I found it was comparing against a string located at 0x804980b which I decided to investigate while doing a test run.

```

(gdb) x/6c 0x804980b
0x804980b:    103 'g' 105 'i' 97 'a' 110 'n' 116 't' 115 's'
(gdb)
» kali:✓

```

I found the string “giants” in the location and when I checked the compare I found that my input did not match the string that I entered. So the function here must be running some kind of cipher on my input and then comparing against the string “giants”

What I did notice was that the cipher seemed consistent and was therefore simply remapping letters. So I did some brute force mapping characters and found that “opekmq” mapped to giants’

```

8048df7: 83 f8 05         cmp     $0x5,%eax

```

I started looking at the code for phase_6 and noticed that read_six_numbers is back so we are looking for 6 spaced out numbers again. I also noticed a compare that was checking if each number was larger than 5 and a bunch of loops that I didn't understand. So far I know the password for this phase is 6 integers spaced out and they have to be less than 6, so I decided to go in and test.

I used the test string 1 2 3 4 5 6 and looked at the contents of %esi and %esi + 8. From This it appears that we are working with a linked list because each node has an element and a pointer to the next node. Based on the compare that I noticed earlier I tried putting the nodes in order from largest to smallest.

The values were node 1: 0x000000fd 2: 0x000002d5 3: 0x0000012d 4: 0x000003e5 5: 0x000000d4 6: 0x000001b0.

Putting those in order we get 4 2 6 3 1 5
