Lab 3

Sample 1

For sample 1 I loaded up the file as an IQ file and set the input rate to 1000000 the bandwidth to 50.09 and then listened to the audio. Eventually I realized it was morse code and the code corresponded to

... --- .-. .-. . / .-. / .-. .-. .-. .-. .-. .-. / .-. / .-. .-. .-. .-. .-. .-. .-. .-. .-. / ... --- .-. .-. .-. /
.. ---

Translated to english.

"SAMPLE 2 WAS CAPTURED AT 146520KHZ SAMPRP 2M"

Here in the waterfall it becomes more clear that we are looking at dots and dashes.

Sample 2

For sample 2 I loaded the iq file and set the input rate to 2000000 with the bandwidth set to 146520 KHz or 14.652 MHz. I had to slightly adjust the frequency to actually make the audio understandable, Eventually I was able to understand a message on repeat that says “The sample was captured at 7.171 MHz and sampled 7m per second”

Sample 3

An error occurred when trying to extract files from the bz2 file and I was not able to get that working.
